CODE OF CONDUCT

ICES was created to optimize and integrate a whole range of embedded systems issues across KTH and industry. Serving as a network and catalyst, we aim to disseminate state-of-art and state-of-practice in the development of embedded systems, and in particular to enable experience sharing between members - how we use methods, tools, architectures, and the lessons we have learned along the way.

In keeping with the spirit of ICES, Members agree to abide by certain guidelines and ethics, including but not restricted to the following:

The research aspects of ICES are primarily enabled through KTH as an academic partner and through ICES Member companies as independent partners. For more information, please see the ICES Vision and Goals document (available from the ICES homepage).

All members are welcome to contribute to ICES Activities and to the ICES Newsletter and on-line News and Calendar (and to other sections of the ICES homepages as appropriate). However, these channels should not be used to market a company’s products or services, but rather to highlight and share experiences of embedded systems issues.

ICES Networks: Names and emails acquired through membership should only be used to promote embedded systems activities / issues genuinely thought to be of interest. ICES Members can of course pass on information and names in relation to ICES and embedded systems issues, but should never share lists of contact details with any other body, nor should an ICES Representative make use of the lists for non-ICES purposes. Anyone suspecting abuse of the lists should contact ices-admin@md.kth.se to voice their concerns.

ICES Seminars: These usually include both research and practice aspects in order to get good cross-fertilization between academia/industry but also industry/industry. For all industry-based seminars associated with ICES (i.e. supported by and promoted by ICES marketing via web and newsletter etc), the following conditions should be met:

- The seminar should shed light upon one or more areas of embedded systems, with a view to experience sharing and knowledge transfer. To assist in this, in addition to speakers from the organising company, at least one other member company speaker should present their experiences in the topic.
- The seminar should not be focused on an individual company marketing their products and services.

More information about ICES can be found on our homepages at:
